

Tech Tip

A common way that computers become infected with viruses is through web browser windows that are set up to trick you into allowing access to your computer. If you see a browser window telling you that your computer has been scanned and/or that viruses have been found, DO NOT click anything within that window, including "OK," "Cancel," or the X at the top of the window. The safest thing to do in this situation is to restart your computer to make sure no dangerous connections are made. [Click here](#) for more information.

Email Marketing Services

Do you need to send emails to a large number of recipients? Did you know that doing so from your normal email address can get your address blacklisted, preventing you from sending emails? 3n1media offers a solution to this problem. We offer email marketing services that allow you to create professional-quality email newsletters and send them to a large audience.

Dear [member_name_first],

Greetings! I hope your summer has been full of cookouts, swimming, and other fun activities. This month, I wanted to use our newsletter to address some common questions and concerns that we have been encountering recently. I hope our tips and articles are helpful to you. Feel free to contact us if anything you read sparks more questions.

- Sean

Internet Filtering

"Do I need some kind of Internet filtering software for my computer?" That's a question we get fairly often, and our answer is a resounding "Yes!"--especially if the person asking it has a family. We know you've heard this over and over again, but we think it's still worth saying: the Internet gives its users unprecedented access to ALL KINDS of content--not all of which is good for your computer or your family. Pornography is readily available at the click of a button. Sites that look legitimate could be fronts for malware or spyware. In other words, any number of problems can come from allowing your computer full, unfettered access to the Internet.

The good news is that the market has responded to the need for applications that block access to harmful content of all kinds. Many operating systems are now adding parental control settings. Filtering software is also a viable option for protection. Programs like Covenant Eyes, Safe Eyes, KidsGoGoGo, and CYBERSitter offer a wide range of features, from filtering to surveillance to limitation of social networking access. If you have multiple computers and don't want to have to subscribe to filtering software for each individual machine, using OpenDNS's filtering capabilities is yet another option for protection. OpenDNS allows you to filter access at the network level (i.e., from your wireless router, firewall, etc.), meaning that access will be filtered for all computers connecting to the Internet in your home.

Which filtering method should you use? Well, that depends on your individual needs. Because we believe filtering is of the utmost importance, we have educated ourselves on the various strengths of each method. We're happy to offer that expertise to you as you make the important decision of how to protect your computer and, more importantly, your family.

Netbooks

If you've been paying attention to the laptop computer market, you've probably noticed the growing popularity of netbooks--you know, those really small laptop computers that go for around \$300 to \$500. You have to admit, being able to carry around a compact computer with full Internet, word processing, and other standard capabilities is pretty attractive--especially at that price.

Contact us about this service today!

"But what's the catch?" you may ask. Well, as with anything, there's a tradeoff. With the small size, long battery life, and low price, you sacrifice processing power, memory, and the more robust features of a fully loaded laptop or desktop computer.

But that doesn't necessarily make them a bad investment. Much in the same way that motor scooters are a good choice of transportation for people who live in the city and rarely travel at speeds over 50 mph, netbooks are a good option for users who really only need a laptop for Internet browsing and word processing. But if you need the extra processing power and memory or a bigger screen and keyboard (if you work on your computer for extended amounts of time, is a small keyboard and a small screen really desirable?), a netbook might not cut it. Just like people who need to travel long distances are better off with a normal-sized car over a trendy motor scooter, users who rely on their computers' more advanced functions should stick with a full-sized laptop.
